Topic is Gyan Bahadur Gurung Sonic Report

My name is Gyan Bahadur Gurung and I would like to mention my background and then describe sonic wave technologies. Since I was young, I was really good at Math. Because of it, I was popular. I completed Intermediate in Science (Grade 12) in 2005. *After that, I went to school for twelve years.* I studied three years of Bachelor Degree in Science (B.Sc.) with a Math major in Tribhuvan University in Bhadrapur, Nepal in 2005, 2007 and 2008. I worked as a teacher for grades 6 to 10 in 2006 and in 2009 whereby I taught Math and Science subjects. I also worked as a tutor for Optional Math subject for grade 10 in 2007. When I was a teacher for two years, I always typed my own test papers in Compulsory Math, Science, and Optional Math subjects. On February 16 of 2010, I left Nepal and came to the United States of America, particularly in Saint Louis, Missouri. I immediately went to a school to learn American English grammar from March of 2010 until mid August of 2010. Then, I spent time learning general Associate Degree classes from August of 2010 to December of 2013 in Saint Louis Community College at Forest Park, Meramec, and Florescent Valley. I did it because I wanted to dive into the American culture of undergraduate study. While I was at Forest Park Community College, I participated in a Math competition held at the University of Missouri in Saint Louis (UMSL) which had students from over 100 community colleges and universities. I along with two other students represented Forest Park Community College. We stood in 10th position meaning that we did beat about ninety other community colleges and universities.

I started studying at the University of Science and Technology in Rolla, MIssouri in January of 2014 and completed my undergraduate degree in computer science in May of 2016. In this degree, I learned to develop software and web sites. After that, I returned home to Saint Louis, Missouri. I spent the rest of 2016 at home simply learning the Java programming platform. I also sharpened my front end concepts such as in HTML, CSS, JavaScript, and Bootstrap. I spent Spring semester of 2017 in University of Missouri in Saint Louis (UMSL) for my Master Degree in Computer Science. I only attended there for one semester. I then switched to the cybersecurity field for my master degree. From May 31, 2017 until March of 2019, I studied for a Master Degree in Cybersecurity Management (MDCM) at Kaplan University (now Purdue Global), an online school located in Saint Louis, Missouri. Here in this online master degree school, I took fourteen courses and wrote on about two hundred and fifty two topics related to cybersecurity. These topics were focused on discussion board topics and essays. I had to look up many resources to write: library materials, text books, and blog posts. I also had to perform practical labs related to the Windows Server environment.

Studying my master degree gave me an opportunity to be really good in finding and looking up information I need on topics I pick. While I was taking those courses, I learned information technology concepts and background. In addition, I learned the security aspect of information technology infrastructure. I believe this course covers mostly everything in information technology and cybersecurity from the point of

application perspective. Next step from there would be to study for a Doctor of Philosophy (Ph.D.) in Cybersecurity,which is basically a theoretical aspect of cybersecurity. This Ph.D. study focuses on making existing information technology and cybersecurity better and competitive. While I was taking master degree classes, I also bought Certified Ethical Hacking (CEH) certification materials and labs. I went through them once and the content in it was really of value and you won't find this nature of content elsewhere. This certification focuses on pen testing a computer network and making a report that centers on advising security recommendations for discovered computer network security weaknesses and vulnerabilities. CEH mainly focuses on penetrating a computer network legally and making sure that network doesn't have any ways for hackers to get in that computer network. One most important tool it covers is Kali Linux. I only studied for a master degree in cybersecurity management.

During this master degree study, I also mastered stock market investment field and poker. I came up with a legacy investment idea with the help of which people can never run out of their rich dollars. Pick bigger companies such as Apple, Google, Alphabet, Amazon, Facebook, and Microsoft. Type company name and type "stock" in Google search engine. You will find a stock graph of that company. Look up a graph for max period and try to find stock price increment per year and do it over a course of many years. You can find profit percent per year or Return of Income (ROI) percent per year of that company for many years from the calculated stock price increment per year. Also, notice the market capitalization of these companies which are pretty big. These companies can give a minimum 10% profit percent or ROI percent per year. Investing in these companies has a low risk because these companies have no way of vanishing from the earth. Since these companies are going to stay forever and they give a minimum 10% ROI percent per year, an investment of $200,000 can be doubled in about eight years or you can earn a minimum pf $20,000 per year forever investing in these bigger companies..You can never run out of $200,000 if you diversify your investment in these bigger companies. I came up with this investment idea in 2018. In this investment idea, a minimum of ten percent is assumed; nonetheless, anyone can do better math to find out exact ROI percentage for every year for all of these companies.

Poker, particularly Texas Hold'em. is another field I mastered in the second half of 2018. I learned hand rankings at first, watched YouTube videos to understand how Poker is played, and read online articles to learn more about the poker profession. I watched many poker final table tournaments videos to understand poker at the professional level. After watching many poker final table and tournament videos, I learned to analyze poker hands and with time I became very good at it. After that, I started playing poker tournaments and after many poker tournaments play in the year 2019 and in the first quarter of 2020, I mastered the art of poker. One should understand that it is only in real poker play experience builds that led to my poker skills

development. It is also true that theoretical preparation and study play a vital role in becoming good at playing poker professionally. I pretty much learned everything that is out there in poker tournaments in which I mastered to play Texas Hold'em

A radio wave is a big thing. Radio waves are used for different purposes. Cell phone towers use radio waves. Satellite networks use radio waves. TVs, radios, vehicle radios, and FMs also use radio waves. There is a type of radio wave that, if used abusively, can paralyze a person's brain and body. RFID stands for radio frequency identifier detection. RFID technology uses radio waves for tracking. RFID technology is used to track money and count money from a stack of money if money is not older than four years. In other words, if money is older than four years, money can't be tracked. Debit cards and credit cards use RFID technology for tracking. Decks of cards and chips in casinos use RFID technology for tracking. Casino card games use RFID technology for detection and tracking. Poker games use RFID chips in cards to detect cards. Texas hold'em is a type of poker game that uses RFID chips in cards to detect cards. After a deck of cards is shuffled, cards of each player can be known before dealing cards to players. Not only that, a winner in that hand can be known without first dealing. That is how accurately RFID chips are used in cards in Texas hold'em.

Sonic wave technology is a pretty big and wonderful technology. Sonic waves are derived from radio waves. In 1993, Arizona University in the U.S. built labs for studying and researching sonic wave technology in rats. A command with the help of sonic waves was given to rats to perform some activities such as eating and the rats ate. In 2000, the U.S. international army figured out human brains emit waves to a certain distance and this can be combined with sonic wave technology to study and research the human brain. Animals also emit waves from their brains to communicate with each other. In a similar manner, human brains also emit waves. The U.S. international army started out developing sonic wave technologies in 2000. The then President Bill Clinton didn't know about these two developments. This project was picked up by Arizona University in 2004. At that time the then President George W. Bush knew little about this development. People from China were hired. They along with experts from the U.S. started out building sonic wave technologies that work with human brains. The U.S. was pretty good at developing details about this sonic wave technology. When they were going in the wrong direction, the Chinese were there to help move forward in the right direction.

By 2008, this Arizona University project was complete. At that time, two sonic wave technologies were complete. One technology that was complete was ***Sonic Wave Voice Technology*** that is used to communicate with each other by humans without using any electronic devices. Each person has a unique sonic wave ID. When one person's ID is connected to another person's ID using software, one person can chat with another person remotely without the help of any technological devices. Many people's IDs can be connected to each other and they can talk with each other remotely.

Many people can talk with each other at the same time. This is parallel programming in a technological sense. When one ID is connected with another ID, you can have a number of features of Sonic Wave Voice Technology. The following are the features of Sonic Wave Voice Technology after it has been updated over a course of many years.

1. Each ID has a shape of a droplet of water.
2. In order to connect one ID with another ID, you have to configure it with ID software.
3. In order to remove IDs from one ID, select that ID in ID software and press Ctrl+A at the same time. Then, press Ctrl+Alt+A. Hidden IDs can't be removed with these commands.
4. Hidden IDs can be removed by doing the following. Select the ID that you want to remove all IDs from. Press Ctrl+Shift+O at the same time. Then press Ctrl+A followed by Ctrl+Alt+A.
5. Using this technology, people can remotely communicate with each other without using any electronic devices. People use ID software to connect one person's ID with another person's ID or other people's IDs. Information is sent from ID software from a computer to a server on the earth and this information is sent from the server to a satellite where the satellite server software connects one ID with one or more IDs. When people's sonic wave IDs are connected and people are talking, people's voices are picked up by sonic waves and are sent to the satellite where digital records are created. Then, the satellite sends voices to connected IDs. Then, after receiving those voices people are able to remotely listen to those voices.
6. One person can remotely communicate with just another person at a given time.
7. Multiple people can remotely communicate with one person at the same time.
8. One person can remotely communicate with many people at the same time.
9. Multiple people can remotely talk at the same time. In this way, you can remotely listen to many people talking at the same time.
10. One person can have more than one ID and each ID can be kept in one person. In this case, a person can listen to more than one person at the same time.
11. People can use a pre-configured command as a unique thought to connect one ID with another IDs.
12. People's voices can be remotely heard from space around you.
13. People's voices can be remotely heard from a distance.
14. People's voices can be remotely heard from inside of a chest.
15. People's voices can be remotely heard from inside of a head.
16. People can remotely talk with each other using music. You can remotely hear music playing and with that music you can remotely hear voices of people.
17. Sonic waves can remotely pick up any continuously generating sound around you and people's voices can be remotely heard from that sound. If there is a

sound around you and that sound is continuously playing or producing, people can remotely talk with that sound.

18. You can hear any continuously playing remote sound and multiple people can remotely talk turnwise with that sound.
19. Sonic waves can remotely pick up a loud noise such as an explosion and people can know where that noise is coming from. Sonic waves can't record from anywhere on this earth. It has to be set up to listen from one or more specific war zones.
20. This technology can change people's voices while talking.

Another technology developed by Arizona University was ***Sonic Wave Souvenir Technology*** that is used to read human minds. With this technology, one person is able to remotely know what another person is thinking. Like in prior technology, no devices are needed. Information from one person's brain is sent to a satellite network where it is digitized. The computer system knows everything about this information. Then, the satellite network sends this information to other people who are connected with each other after which one person is able to know what another person is thinking. Backup data are also created on earth from the satellite system. Like Sonic Wave Voice Technology, Sonic Wave Souvenir Technology has been updated over a course of many years. Souvenir Technology has a number of features when one ID is connected with one or more IDs. The following are the features of sonic wave souvenir technology.

1. This technology is used to have a women's hair band shaped object that sits on the back of the top portion of a head. How is it used? People who want to listen to the thoughts of a person must be connected to that person with sonic wave IDs and they must individually have a hair band object on the back of the top portion of their head. People use ID software to connect one ID with one or more sonic wave IDs. Information is sent from ID software to a server on the earth. From the server this information is sent to a satellite where IDs are connected with each other. With this set up, that person's thoughts are picked up by sonic waves and are sent to the satellite and from the satellite these thoughts are sent to connected people. After that connected people receive these thoughts and replay these thoughts in their brain after which people on the receiving end know what that person is thinking.
2. Now, in order to listen to the thoughts of a person by one or more persons, you have to configure it with ID software.
3. By using this technology, you can listen to the thoughts of another person. You can know exactly what another person is thinking. People use ID software to connect one sonic wave ID with one or more sonic wave IDs and to set up people to listen to the thoughts of other people. Information is sent from ID software from a computer to a server on the earth and this information is sent from the server to a satellite where the satellite software connects one ID with

one or more IDs and sets up people to listen to the thoughts of other people. When people's IDs are connected and people are set up to listen to the thoughts of other people, human thoughts are picked up by sonic waves and are sent to the satellite where digital records are created. Then, the satellite sends thoughts to connected IDs after which connected people listen to those thoughts and connected people know exactly what another person is thinking.

4. More than one person can listen to the thoughts of a person.
5. One person can listen to the thoughts of more than one person.
6. You can use a pre-configured command as one particular thought to send a pee sensation to another person after which after receiving a pee sensation that person has a feeling of pee. This thought command goes to a satellite network and from there pee sensation is sent to connected IDs. Connected people receive this pee sensation after which people have the sensation to pee.
7. In a similar manner, you can also send shit sensation to connected people using pre-configured thought commands. This shit sensation creates a sensation to throw shit.
8. You can send a particular thought to a person. That thought can be for informational purposes or for decision making. A person who is receiving thought from another person can know that thought coming in his or her head. That thought command can also be difficult to detect in a head. If that happens, it is dangerous because that person has the tendency to carry out bad decisions.
9. By using this technology, you can distract people for a short amount of time to make them concentrate on nothing and do nothing.
10. A thought can even drop an object inside of a person's body. A thought can be pre-configured in a satellite system. When that thought command is received by the satellite system, an object can be dropped in a person's ID.
11. A thought can make a person fart. In this case too, a thought command can be configured in a satellite system and when that thought command is sent to the satellite system, a fart sensation can be sent to a person. On the receiving end, that person receives that fart sensation after which that person farts or has the tendency to fart depending on the nature of fart sensation sent by the satellite system.

This development of sonic wave technologies was made even bigger in 2010. My (Gyan Bahadur Gurung) sonic wave ID was created in 2010 as well. Two additional technologies were developed in 2010. One technology is ***Sonic Wave Small Scale Object technology*** and another technology is ***Sonic Wave Sensation Technology***. Sonic wave small scale object technology makes small scale objects from plastic which can pass through house roofs and human body parts such as human organs, flesh, and bones. As of April 25, 2024, I don't think this technology has killed any people, Sonic Wave Small Scale Object Technology has been updated over a course of many years.

These plastic objects are manufactured in California in the U.S. and also in the UK. This small scale object technology has the following features.

1. Small scale objects are micro scaled and are made from plastic.
2. Small scale objects have the shape of different objects such as thread, scissor, hand, knife, liquid, rod, bar of an object, and a droplet of water.
3. These objects can pass through house roofs, skin, flesh and bones.
4. People use ID software to use small objects on different people's sonic wave IDs. Information is sent from ID software to a server on the earth where these plastic objects are created and from there these plastic objects are sent to a satellite from where they are sent to connected IDs.In this way, small plastic objects are created and sent from ID software to another person's head or body.
5. People can pour small scaled liquid into a person's head and body. This liquid generates a hot sensation. People use ID software to drop hot liquid in a person's head or body. Information is sent from ID software to a server where hot liquid is created and is sent to a satellite. From the satellite, this hot liquid is sent to a person's ID after which that person receives a hot sensation in his or her head or body.
6. This technology allows people to use ID software to send droplets of liquid on a surface of a person's head and body. This produces a cold sensation in a person's head or body. Similarly, there are many other objects created in this technology.

With ***Sonic Wave Sensation Technology***, you can send sensations to human brains to make people sneeze and cough a lot. In the Spring Semester of 2016 when I was graduating from University of Science and Technology in Rolla, Missouri, this technology was lightly used in my (Gyan Bahadur Gurung) brain. I was coughing a bit and then I started sneezing. In May of 2016, I returned home and then this sensation technology was badly used in my brain. I was coughing a little bit, but I was sneezing a lot. This sneezing made me throw a lot of watery nasal releases. This occurred to me for about five months. Someone I knew told me I could take a medication known as Allegra. I went to Walgreen and bought Allegra. I started taking this medication and slowly this sneezing got stopped. 2017 was the year MIT started developing additional sonic wave technologies. After 2017, MIT developed the following sonic wave technologies.

1. MIT developed ***Sonic Wave Seeing Eye (Akha) Technology***. This technology is used to see from another person's eyes remotely without using any technological devices. No matter how far away but as long as there is a reach of a satellite network, one person can see exactly what another person sees with the help of this technology. MIT employed two people from Tamil Nadu, India who developed akha or seeing eye technology. These two got training from MIT and used MIT resources. Therefore, we say MIT developed this technology.

2. MIT updated ***Sonic Wave Sensation Technology***. With this technology one person knows another person's body sensations. These sensations include touch, pain, cut, pee, erection, ejaculation, shit, heat, cold, and other body sensations. This is an updated version of prior Sonic Wave Sensation Technology.

Arizona University first developed three sonic wave technologies after 2017. One technology is **Sonic Wave Photo Technology** that is used to display photos of objects to people as per their thoughts. Another technology is ***Sonic Wave Video Technology*** and it is used to show videos to people in their brain, it is mainly used to show dreams to people in their sleep. Videos have to be sent from a computer to a satellite network from where these videos are sent to connected IDs or connected brains after which people see these videos in their brain. Another technology is **Sonic Wave Memory Technology** that is used to extract human memory data/information from a human brain. It was developed in February of 2021. Actually, two retired international army people trained by Arizona University developed sonic wave memory technology. There is information or data in a human brain that human beings build up over time. This information or data can be extracted from a human brain by using computer probes and advanced devices. Now, this information can also be extracted remotely by this technology without using any technological devices. With this technology, people can go back in time and find out what has developed in a human memory. Data extracted from a human brain have no date and time. You have to ask people for a relative timeline of when a certain memory has developed and put that approximate date in a memory database in a computer. After the development of these ***sonic wave photo technology, sonic wave video technology, and sonic wave memory technology*** in February of 2021, ***Sonic Wave Akha Technology*** was developed in March of 2021 followed by the development of ***Sonic Wave Sensation Technology*** in March of 2021.

My sonic wave ID is the luckiest ID because people developed these five small scale sonic wave technologies (photo technology, video technology, memory technology, akha technology, and sensation technology) and installed them firsthand on my sonic wave ID. In February of 2021, three sonic wave technologies, namely sonic wave photo technology, sonic wave video technology, and sonic wave memory technology, were installed for the first time on my sonic wave ID. Then, Sonic Wave Akha Technology was installed on my sonic wave ID in March of 2021. Lastly, Sonic Wave Sensation Technology was installed on my sonic wave ID in March of 2021. These five sonic wave technologies I have received and me as a person who has received these technologies first hand are two different things.

My sonic wave ID was created in 2010, but I knew I have my sonic wave ID only in 2021. In one day in February of 2021, I was asked to walk out of my house at 4624 Alaska Avenue, Saint Louis, Missouri, 63111. I had other people's sonic wave IDs in my

head and they were talking to me. I was just listening to them. On that day, I got out of my house and started walking in the north direction. At that time, my white Toyota Corolla car was in the parking lot of the Emergency Department of Saint Louis University Hospital of Saint Louis city county in Saint Louis, Missouri. After walking for a couple of minutes, I was asked to abide by the rule that states to only walk on a path once. While walking I had to make sure that I never walked on a path twice. I selected a random path and direction towards the north direction from where I lived. I kept on walking even though my legs and body were tired.

Finally, I reached a street that was facing East-West. I was walking in the West direction on the left side of that street. Then, I turned around because I arrived at the end of that street. Then, I started walking in the East direction. I wanted to rest; therefore, I sat down by the side of a street. This is when one technology (***memory technology***) that is used to extract human memory from human brains started to install in top portion of my head. This technology has a set of three black small scale cuboidal objects attached to each other. However, this technology doesn't use that set of three cuboidal objects anymore. Now, this technology works without that set of cuboidal objects. In other words, this technology works both with and without that set of cuboidal objects. I was sitting down and my head was leaning forward slightly. This cuboidal set of objects started to fall in the downward direction and it was trying to get in on top of my head. My head was leaning forward and this set of objects wanted to install in top portion of my head in a vertical downward direction. The set of objects was trying to fall in on top portion of my head, but it couldn’t because my head was slightly leaning forward. This gave me pain and I thought my brain was cracking and separating apart very slowly. I felt my life was at risk. At that time my younger brother Rajendra Gurung told me to make my head straight up. In order to avoid that pain, I made my head straight up. After that this set of objects successfully went in on top of my head. I felt that set of objects in top portion of my head. After some weeks, this type of insertion of this set of objects on top of a head became seamless because the scale of this set of objects was reduced and this installation of this set of objects became possible irrespective of any position of a head.

I stood up only to find out a metropolitan police van with an African American police officer stopped in front of me. He asked me why I was there. I replied that I was trying to return home. He let me walk some distance. Since I was really tired and sleepy, I could only walk slowly and for about a minute. That is when he turned around his vehicle and asked me the same question. I answered with the same reply. After that I walked some distance after which another cuboidal set of objects (two small scale cuboidal and black colored objects attached with each other) was trying to go inward on back portion of my head. This technology is ***sonic wave memory technology***. My head was in a vertical position and this set of objects had to be installed in the downward direction. As it was rubbing against back portion of my head, I wanted to get

rid of that pain it was causing because this set of objects was trying to install in the downward direction when my head position was straight up. All I had to do in order to make sure this insertion of objects was successful was to lean my head a little forward. Then, this installation on back portion of my head was successful. I felt this set of objects in the back portion of my head. After some weeks, this installation of these objects became possible irrespective of any position of a head. Also, the scale of this set of objects was reduced to make insertion of it on the back of my head seamless.

At the time of two installations of these two sets of objects, scales of these objects and directions of installation weren't right, but they fixed them later. After that, there was no pain while putting these sets of objects in my head and they could put in my head from any direction irrespective of position of my head and body. Directions of these installations exclude installations in the upward direction. I walked some distance after which three metropolitan vans with three police officers stopped and asked me why I was there and where I lived. I said I wanted to go home and I gave my home address. After verifying where I lived, they drove me south to get me home. They asked my mother and brother if I lived there at 4624 Alaska Alaska Ave, Saint Louis, Missouri, 63111. They verified that I lived at that address and drove away. These two installations were related to sonic wave memory technology. This technology is used to extract a human memory rom any human brain which creates a memory data file. This data file has to be replayed in any human brain to know the content of extracted human memory. In this way a whole life history of any person can be known with the help of this technology.

While I was at home in March of 2021 after receiving aforementioned technologies (sonic wave photo technology, sonic wave video technology and sonic wave memory technology) on my sonic wave ID in February of 2021, I also received ***Seeing Eye (Akha) technology*** because of which one person can see exactly through another person's eyes remotely. I am the first person to receive this technology. This fourth technology has a cuboidal shaped object and an eyeglass shaped small scale object. You must keep a small scale cuboidal object in top portion of a person's head and you must keep an eyeglass shaped object on top of another person's head who wants to see through the person's eyes who has that cuboidal object. And they must be connected with each other via sonic wave IDs. With this set up, one person with an eyeglass object sees exactly through another person's eyes who has that cuboidal object. If more than one person with eye glasses on top of their head are connected to a person's sonic ID who has a cuboidal object, these people see exactly what that center person sees. If they keep one or more eye glasses with that center person, people whose eye glasses stay with the center person see an additional angle of view than normal vision of that center person. In other words, they see different views of surroundings than that center person does.

Now, this technology works without the cuboidal object and eye glass object. People simply use ID software to set up people to see from another person's eyes. You can use ID software to connect one ID with another one or more IDs. Information is sent from ID software to a server on the earth and from that server that information is sent to a satellite where sonic wave IDs are connected. Similarly, you can also use ID software to set up people to see from another person's eyes. This setup eventually gets configured in the satellite. When sonic wave IDs of people are connected to each other and one or more people are configured to see from a person's eyes, sonic waves pick up things that person sees and send it to the satellite. From the satellite this information is sent to other people whose IDs are connected to that person's ID and to the people who are configured to see from that person's eyes. On the receiving end people receive this information sent from that person and they receive it in their brain. After that people are able to see from that person's eyes.

At a higher level, it is important to understand how these different sonic wave technologies work. Biology of seeing things in front of you involves capturing view in front of your eyes and sending it through your eyes to retina where images are formed. Then the brain processes those images which make it possible to see things in front of you. Akha or seeing eye technology captures this formation of images and sends it to a satellite and the satellite sends that information to other people connected with sonic wave IDs and that have eye glasses objects. This will enable other people to see exactly what is seen by the person who has a cuboidal object. Similarly, in other types of technologies, information is sent from a human brain to the satellite network from where information is sent to other people connected by sonic wave IDs. After receiving information, other people connected by sonic wave IDs are able to listen to voices, to read other people's thoughts, to see from another person's eyes and to sense other people's sensations. Seeing Eye (Akha) Technology with a small scale cuboidal shaped object and an eyeglass shaped object has a number of interesting features. People connected to a center person must have their sonic wave IDs with the center person and other people connected with the center person via sonic wave IDs must have small scale eyeglass objects individually. The center person must have a small scale cuboidal object. This set up makes it possible for everyone to see what the center person sees. However, this technology no longer uses a cuboidal shaped object and eye glass shaped object. This technology works without the cuboidal object and eyeglass shaped object. You have to use ID software in order to set up people to see through another person's eyes. The person who is at the center keeping their IDs can see features associated with Akha (Seeing Eye) technology. Other people who are connected with the center person via sonic wave IDs see all these features. The following are the features.

1. This technology can make a person or more than one person see exactly what another person is seeing in front of him or her. With this technology, you can remotely see from another person's eyes.
2. When a person’s eyes are closed, he or she can be made to see images in the space inside of closed eyes, on the surface of closed eyes, and in the air outside of closed eyes. This display of images is positional in nature meaning that they are shown in these positions.
3. Images can also be made to see on a side corner surface of open eyes.
4. A person can be made to see images in different positions in and around him or her and even up in the air.
5. A person can be made to see objects associated with a technology that has small scale sharp cutting objects. These objects are seen in different positions in and around you based on their positions compared to your body.
6. There is a layer of an object that sits on your head and body. If you change the shape of this layer, you can see its changed shape.
7. With this technology, you can even see sonic wave ID and souvenir objects in their positions on the top portion of your head.
8. This technology makes it possible to see any objects that are involved in small scale sonic wave technologies.
9. This Seeing Eye (Akha) technology can take a picture of a view in front of you.
10. On a lighted screen a photo can be displayed continuously to make it look like that photo view is a video display.
11. With the help of this technology, a person can be made to see images even in the air at a lower level or up in the air. The display of images can be just in front of him or her or it can be at a distance.
12. Multiple images can also be made to see one after another in the air.
13. If you open your eyes slowly and try to look at a light bulb, you can see a lighted screen on and near the surface of that light bulb and on it you can see images. These images can be slowly rotating in nature, can be 2D images or can be 3D images.
14. An image can also be made to see on a colored char. I have seen a 3D view of a person sitting on a colored chair as soon as I woke up in 2021.
15. Colored light can be transmitted to a surface and you can see bright images on that surface.
16. Multiple images can also be made to see turnwise on a surface.
17. This technology is also capable of making letters and objects clearer to see. For example, you can look at letters written on a surface and these letters can be made clearer to see. This is similar to wearing eye glasses by a person who has eye defects and to seeing distant objects.

18. This technology can also make a person see things less clearly than a normal vision of that person. You see an unclear surface when it happens. For example, if you are reading, letters can be made unclear to see than a normal vision of a person.
19. A recorded video from a camera can be sent to a person. That person sees that video in different positions based on where it is set up to see.
20. With the help of this technology, one person can see a different focus of vision than another person's focus of vision. For example, if you are trying to see what another person is seeing, this technology can help see what person is not seeing in his or her focus of vision.
21. By using this technology, you can change a person's focus of vision. In other words, you can make a person see a certain focus of vision than that person intends to see.

After receiving this Akha technology firsthand on my sonic wave ID, I also received ***sonic wave sensation technology*** firsthand on my sonic wave ID in March of 2021. This technology has a comb object that is a small scale object that resembles a comb of a hair cutting device set of comb objects. This comb like object was installed firsthand on my sonic wave ID. This object was put on my sonic wave ID first hand after installing four sonic wave technologies, namely sonic wave photo technology, sonic wave video technology, sonic wave memory technology and sonic wave seeing eye (akha) technology, on my ID, as I have mentioned earlier. Thereafter, fourteen of these objects were created. These objects were then kept in fourteen people namely Gyan Bahadur Gurung (me), D.B. Bhattarai, Suk Regmi, Khina Chaun, Vaskar Sharma, Bhupal Adhikari, Rajiv Gurung, Kiran Sharma, Apsana Upreti, Vivek Khatri, Hem Subedi, Hem Adhikari, Puskar Shrestha, and Hammont Upreti. These people kept these objects individually. But, people gathered these fourteen objects and kept them on my ID alone. I don't want this in this way because I am Seeing Eye Technology, the first person to receive Akha (Seeing Eye) technology. Here, I would also like to mention features of sonic wave sensation technology, which have been updated over a course of many years, in the following.

1. People use ID software to connect one sonic wave ID with one or more sonic wave IDs. After IDs are connected in ID software information is sent from that ID software to a server on the earth. From that server that information is sent to a satellite where sonic wave IDs are connected. In this way, IDs are connected to each other. After sonic wave IDs are connected and a comb like a small scale object is placed in a person's head or body, sensations of that person's head or body are sent to the satellite by sonic waves and from the satellite the satellite sends those sensations to connected people. People whose IDs are connected receive those sensations and they replay these sensations in their head or body. That is how one person can know another person's sensations in this technology.

You can also record sensations and replay those sensations in a person's head or body by using ID software. People use ID software to send recorded sensations to a person's head or body. Information is sent from ID software to a server on the earth and from there that information is sent to the satellite. Depending on the information received, the satellite can send recorded sensations to specified IDs that are set up in ID software. You can also record a particular sensation in a satellite when that sensation is received by the satellite. And, when that sensation is received at the satellite again, its corresponding recorded sensation can be sent to connected people.

2. This technology can make people uncontrollably shit or pee in his or her clothes. This is like elderly people shitting or peeing in their clothes. A person’s shit sensation or pee sensation gets picked up by sonic waves from the person’s brain and is sent to a satellite from where these sensations are sent to connected IDs. On the receiving end, people receive these sensations after which they either shit or pee uncontrollably. These sensations can also be recorded in a satellite system and using computer software these sensations can be sent to people after which they uncontrollably shit or pee. These recorded sensations can also be sent to connected people when such shit or pee sensations are received at the satellite. Similarly, all activities that take place in a person’s head or body can be directly sent to another person's brain and can also be recorded and sent to a person’s head or body by using computer software or by using received sensations.
3. A person can open eyes and close eyes repetitively and this sensation can be sent to a satellite from where it is sent to connected IDs. After receiving this sensation people on the receiving end open and close eyes repetitively and automatically. This sensation can also be recorded in a satellite system. When that person opens and closes eyes repetitively, that sensation is sent to the satellite from where the corresponding recorded sensation can be sent to people who are connected through sonic wave IDs. On the receiving end, people receive this recorded sensation and they open and close their eyes repetitively and automatically. This recorded sensation can also be sent to a person by using ID software. Similarly, all sensations can be sent directly to connected people by the satellite system and all sensations can be recorded in a satellite system and when those sensations are sent from a person's brain to the satellite those corresponding recorded sensations can be sent to connected IDs. These recorded sensations can also be sent to a person’s brain by using computer software (ID software).
4. This technology can make it difficult for people to pronounce words.
5. This technology can make people say words other than what the talking person intends to pronounce.

6. This technology can make it possible to sense another person’s taste of food.
7. This technology can help smell another person’s breath. A person's breath can be sent to a satellite from where it is sent to connected IDs. On the receiving end people receive this sensation after which they smell that person's breath.
8. With this technology, one person can sense another person’s touch, cut, pain, and muscle or bone squeeze. Also, think of all the anti sensations of these sensations.
9. This technology can make people feel hungry to eat. On the contrary, this technology can make people feel not hungry to not eat or to eat less food.
10. With this technology, you can make people leak sexual release and also you can make people ejaculate while showing dreams to people. A sexual release sensation makes a person leak sexual release and an ejaculation sensation sent to a person when he or she is sleeping makes that person ejaculate if that person is being shown a dream with sonic wave photos and videos technology.
11. You can also send an anti sexual leak sensation to a person to whom a sexual leak sensation has been sent. When it happens that person doesn’t sexually leak.
12. An anti-ejaculation sensation can be recorded in a satellite system and sent to a person to whom a dream is being shown and an ejaculation sensation has been sent. If the person has received a recorded ejaculation sensation, that person ejaculates, but if the person receives an anti ejaculaiton sensation after receiving an ejaculation sensation in a dream, that person doesn’t ejaculate.
13. Using this technology, you can make people fall asleep.
14. This technology can make people wake up from sleep.
15. With the help of this technology, you can make people unconscious.
16. This technology can help sense the presence of small scale objects in another person's head or body. There are many small objects and for each use of a small object its corresponding sensation can be sent to a satellite from where it is sent to connected IDs. After receiving this sensation people can know this sensation of use of the small object.
17. Using this technology, you can make people feel like smoking a lot. You can also send other eating or drinking sensations to a person to make that person eat a lot or drink a lot.
18. This technology can make a person fart too.
19. With this technology, you can make a person yawn.
20. You can use this technology to send pee sensation and poof sensation to a person after which that person pees or passes stool.
21. An anti poof sensation can be recorded and sent to a person after which on the receiving end the person is unable to throw out shit for a short period of time.

22. An anti pee sensation can be recorded in a satellite system and be sent to a person who is trying to pee. When this happens that person can hold pee for sometimes.
23. Using this technology, you can send heat sensation and cold sensation to a person. It can help in extreme weather conditions.
24. By using this technology, you can send a chilly like hot sensation to a person's eyes. When this happens there is a hot burning sensation in that person's eyes and tears might develop in that person's eyes.
25. With the help of this technology, one person can smell what another person is smelling.
26. In this technology, sensations such as cut, pain, touch, grab, and muscle or bone squeeze can be recorded. Then, these recorded sensations can be sent to a person's brain or body after which that person knows those sensations.
27. This technology can make a person sneeze a lot or cough a lot. You can minimize this effect by taking in allergy medications such as Allegra that is an over the counter medication that doesn't require any prescription.
28. With this technology, one person can know another person's body sensations such as while having sex.
29. By using this technology, you can send a sensation that is sexual in nature to a person's body. With this sensation, that person feels like having sexual intercourse.
30. You can also send an anti sexual sensation to a person to whom a sexual sensation has been sent. On the receiving end the person doesn’t feel like having sexual intercourse when it happens.
31. With this technology, you can make a person feel like vomiting.
32. This technology can create a weak sleeping sensation in the hands of a person.
33. By using this technology, you can smell anything that is beyond the reach of a person and you can make that person smell what is recorded as a smell. In other words, you can make a person smell what he or she can’t smell.
34. An itching sensation can be sent to a satellite from a person’s brain from where it is sent to connected IDs. On the receiving end people receive this sensation and know the itching sensation taking place in another person’s head or body.
35. A pinching sensation can also be sent to a satellite and from there it is sent to connected IDs. After receiving it people know the pinching sensation occurring in another person’s head or body.
36. A person can throw a nasal release and that sensation can be sent to a satellite from that person's brain. From the satellite this sensation can be sent to connected IDs after which people on the receiving end know that person's sensation.

37. An activity that corresponds to pulling inward nasal release can be sent to a satellite and from there it is sent to connected IDs. After receiving this sensation people on the receiving end know this sensation taking place in another person's nose.
38. An activity that corresponds to releasing thick mouth sticky release can be sent to a satellite from where it is sent to connected IDs. After receiving this sensation people know the sensation taking place in another person's mouth. Similarly, an anti sensation to stop releasing thick mouth substance can also be sent to another person's brain via the satellite system.
39. In this technology a person can smile and send a smile sensation to another person after which on the receiving end the person who receives the smile sensation smiles too. How does it work? A smile sensation is sent to a satellite and from there it is sent to connected IDs.
40. In this technology a person can laugh and send a laugh sensation to another person. On the receiving end the person receives the laugh sensation after which he or she laughs.
41. With this technology, you can make a person do unintended actions. For example, if you are moving your hand to carry out a certain task, you can make him or her perform an unintended action that that person has not thought about.
42. This technology can work with other body sensations and anti sensations of these sensations. These sensations include happiness sensation, sad sensation, depression sensation, sweat sensation, common cold sensation, fully awake sensation, anti sleep sensation or excited sensation.
43. This technology can also make a person unable to hear anything for about two seconds.

I am the first person to receive five sonic wave technologies namely ***Sonic Wave Photo Technology***, ***Sonic Wave Video Technology***, **Sonic Wave Memory Technology,** ***Sonic Wave Akha (Seeing Eye) Technology***, **and** ***Sonic Wave Sensation Technology***. The first technology from the above five technologies is used to show photos of objects to people that they think. The second technology is used to show videos to people in their brain usually in their sleep and also while showing preplanned dreams to people, The third technology is used to extract a human memory from a human brain to look into memory history to find out what has developed in a human memory. The fourth technology is used to see exactly through another person's eyes. The fifth (final) technology is used to sense another person's body sensations such as pain, cut, muscle squeeze, pee, shit, and other body sensations. These five technologies are what I like very much and I feel lucky to be a part of these technologies. Now, many people are connected to my sonic wave IDs with their sonic wave IDs. I just need to manage these IDs because I have been keeping them since February of 2021. But, I would like to admit that these people's sonic wave IDs kept with

me combined with their expertise in using small scale sharp cutting objects are what make me feel unsafe. Therefore, I need access to ID software that is used to manage sonic wave IDs.

I wrote this report with the intention to help people around the globe know about these aforementioned sonic wave technologies. Rather than some foreigners inform us about sonic wave technologies, it is better we people in the U.S. inform each other about sonic wave technologies. It is difficult to find any good information about sonic wave technologies online and in other places. This report covers pretty much that is out there in sonic wave technologies. I wish all people on this earth to read this report and get informed about these sonic wave technologies. Society of these sonic wave technologies is big and now rapidly spreading around the globe. With that kept in mind, any help would be greatly appreciated. You can fully read this report and understand about sonic wave technologies. Also, you can transfer money to the following account details.

Name : Gyan Bahadur Gurung
Phone : 314-685-7632
Email : gy1ngurung@gmail.com
Account number : 3550-1522-2405
